S34ML16G2

16 Gb, 4-Bit ECC, x8 I/O, 3 V V_{CC} NAND Flash for Embedded

General Description

Cypress S34ML16G2 16-Gb NAND is offered in 3.3 V_{CC} with x8 I/O interface. This document contains information for the S34ML16G2 device, which is a quad-die stack of four S34ML04G2 die. For detailed specifications, please refer to the discrete die data sheet: S34ML01G2_04G2.

Distinctive Characteristics

- Density
  - 16 Gb (4 Gb × 4)
- Architecture (For each 4 Gb device)
  - Input / Output Bus Width: 8-bits
  - Page Size: (2048 + 128) bytes; 128-byte spare area
  - Block Size: 64 Pages or (128k + 8k) bytes
  - Plane Size
    - 2048 Blocks per Plane or (256M + 16M) bytes
  - Device Size
    - 2 Planes per Device or 512 Mbyte
- NAND Flash Interface
  - Open NAND Flash Interface (ONFI) 1.0 compliant
  - Address, Data and Commands multiplexed
- Supply Voltage
  - 3.3 V device: Vcc = 2.7 V ~ 3.6 V
- Security
  - One Time Programmable (OTP) area
  - Serial number (unique ID)
  - Hardware program/erase disabled during power transition
- Additional Features
  - Supports Multiplane Program and Erase commands
  - Supports Copy Back Program
  - Supports Multiplane Copy Back Program
  - Supports Read Cache
- Electronic Signature
  - Manufacturer ID: 01h
- Operating Temperature
  - Industrial: –40 °C to 85 °C

Performance

- Page Read / Program
  - Random access: 30 µs (Max)
  - Sequential access: 25 ns (Min)
  - Program time / Multiplane Program time: 300 µs (Typ)
- Block Erase / Multiplane Erase
  - Block Erase time: 3.5 ms (Typ)
- Reliability
  - 100,000 Program / Erase cycles (Typ) (with 4-bit ECC per 528 bytes)
  - 10 Year Data retention (Typ)
  - Blocks zero and one are valid and will be valid for at least 1000 program-erase cycles with ECC
- Package Options
  - Lead Free and Low Halogen
  - 48-Pin TSOP 12 × 20 × 1.2 mm
  - 63-Ball BGA 9 × 11 × 1.2 mm

2. Pin Description

Pin Description

Pin Name	Description
I/O0 - I/O7	**Inputs/Outputs**. The I/O pins are used for command input, address input, data input, and data output. The I/O pins float to High-Z when the device is deselected or the outputs are disabled.
CLE	**Command Latch Enable.** This input activates the latching of the I/O inputs inside the Command Register on the rising edge of Write Enable (WE#).
ALE	**Address Latch Enable.** This input activates the latching of the I/O inputs inside the Address Register on the rising edge of Write Enable (WE#).
CE#	**Chip Enable.** This input controls the selection of the device. When the device is not busy CE# low selects the memory.
WE#	**Write Enable.** This input latches Command, Address and Data. The I/O inputs are latched on the rising edge of WE#.
RE#	**Read Enable.** The RE# input is the serial data-out control, and when active drives the data onto the I/O bus. Data is valid t_{REA} after the falling edge of RE# which also increments the internal column address counter by one.
WP#	**Write Protect.** The WP# pin, when low, provides hardware protection against undesired data modification (program / erase).
R/B#	**Ready Busy**. The Ready/Busy output is an Open Drain pin that signals the state of the memory.
VCC	**Supply Voltage**. The V_{CC} supplies the power for all the operations (Read, Program, Erase). An internal lock circuit prevents the insertion of Commands when V_{CC} is less than V_{LKO}.
VSS	**Ground.**
NC	**Not Connected.**

Notes:

1. *A 0.1 µF capacitor should be connected between the V_{CC} Supply Voltage pin and the V_{SS} Ground pin to decouple the current surges from the power supply. The PCB track widths must be sufficient to carry the currents required during program and erase operations.*
2. *An internal voltage detector disables all functions whenever V_{CC} is below 1.8V to protect the device from any involuntary program/erase during power transitions.*

5th / Row Add. 3(6)	A28 (BA9)	A29 (BA10)	A30 (BA11)	A31 (BA12)	Low	Low	Low	Low

Notes:

1. *CAx = Column Address bit.*
2. *PAx = Page Address bit.*
3. *PLA0 = Plane Address bit zero.*
4. *BAx = Block Address bit.*
5. *Block address concatenated with page address and plane address = actual page address, also known as the row address.*
6. *A31 for 16 Gb (4 Gb x 4 - QDP)*

For the address bits, the following rules apply:

- A0 - A11: column address in the page
- A12 - A17: page address in the block
- A18: plane address (for multiplane operations) / block address (for normal operations)
- A19 - A31: block address

5. Read Status Enhanced

Read Status Enhanced is used to retrieve the status value for a previous operation in the following cases:

- In the case of concurrent operations on a multi-die stack.

  When four dies are stacked to form a quad-die package (QDP), it is possible to run one operation on the first die, then activate a different operation on the second die, for example: Erase while Read, Read while Program, etc.
- In the case of multiplane operations in the same die.

6. Read ID

The device contains a product identification mode, initiated by writing 90h to the command register, followed by an address input of 00h.

Note: If you want to execute Read Status command (0x70) after Read ID sequence, you should input dummy command (0x00) before Read Status command (0x70).

For the S34ML16G2 device, five read cycles sequentially output the manufacturer code (01h), and the device code and 3rd, 4th, and 5th cycle ID, respectively. The command register remains in Read ID mode until further commands are issued to it.

6.1 Read Parameter Page

The device supports the ONFI Read Parameter Page operation, initiated by writing ECh to the command register, followed by an address input of 00h. The command register remains in Parameter Page mode until further commands are issued to it. Table explains the parameter fields.

Note: For 32nm Cypress NAND, for a particular condition, the Read Parameter Page command does not give the correct values. To overcome this issue, the host must issue a Reset command before the Read Parameter Page command. Issuance of Reset before the Read Parameter Page command will provide the correct values and will not output 00h values.

Output Low Voltage		V_{OL}	I_{OL} = 2.1 mA	—	—	0.4	V
Output Low Current (R/B#)		$I_{OL(R/B\#)}$	V_{OL} = 0.4V	8	10	—	mA
Erase and Program Lockout Voltage		V_{LKO}	—	—	1.8	—	V

Notes:

1. *All V_{CC} pins, and V_{SS} pins respectively, are shorted together.*
2. *Values listed in this table refer to the complete voltage range for V_{CC} and to a single device in case of device stacking.*
3. *All current measurements are performed with a 0.1 µF capacitor connected between the V_{CC} Supply Voltage pin and the V_{SS} Ground pin.*
4. *Standby current measurement can be performed after the device has completed the initialization process at power up.*

7.4 Pin Capacitance

Pin Capacitance (TA = 25°C, f = 1.0 MHz)

Parameter	Symbol	Test Condition	Min	Max	Unit
Input	C_{IN}	V_{IN} = 0V	—	10	pF
Input / Output	C_{IO}	V_{IL} = 0V	—	10	pF

Note:

1. For the stacked devices version the Input is 10 pF x [number of stacked chips] and the Input/Output is 10 pF x [number of stacked chips].

7.5 Power Consumptions and Pin Capacitance for Allowed Stacking Configurations

When multiple dies are stacked in the same package, the power consumption of the stack will increase according to the number of chips. As an example, the standby current is the sum of the standby currents of all the chips, while the active power consumption depends on the number of chips concurrently executing different operations.

When multiple dies are stacked in the same package the pin/ball capacitance for the single input and the single input/output of the combo package must be calculated based on the number of chips sharing that input or that pin/ball.
