KA3846

SMPS Controller

Features

- Automatic Feed Forward Compensation
- Programmable Pulse by Pulse Current Limiting
- Automatic Symmetry Correction in Push-Pull Configuration
- Enhanced Load Response Characteristics
- Parallel Operation Capability for Modulator Power Systems
- Differential Current Sense Amplifier with Common Mode Range
- Double Pulse Suppression
- 200mA Totem-Pole Outputs
- ±2% Band gap Reference
- Under-Voltage Lockout
- Soft-Start Capability
- Shutdown Terminal
- 500KHz Operation

Description

The KA3846 control IC provides all of the necessary features to implement fixed frequency, current mode control schemes while maintaining a minimum external parts count. The superior performance of this technique can be measured in improved line regulation, enhanced load response characteristics, and a simpler, easier-to-design control loop. Topological advantages include inherent pulse-by-pulse current limiting capability, automatic symmetry correction for push-pull converters, and the ability to parallel "power module" while maintaining equal current sharing. Protection circuitry includes built-in-under-voltage lockout and programmable current limit in addition to soft-start capability. A shutdown function is also available which can initiate either a complete shutdown with automatic restart or latch the supply off. Other features include fully latched operation, double pulse suppression, deadtime adjust capability, and ±2% trimmed bandgap reference. The KA3846 features low outputs in the OFF state.

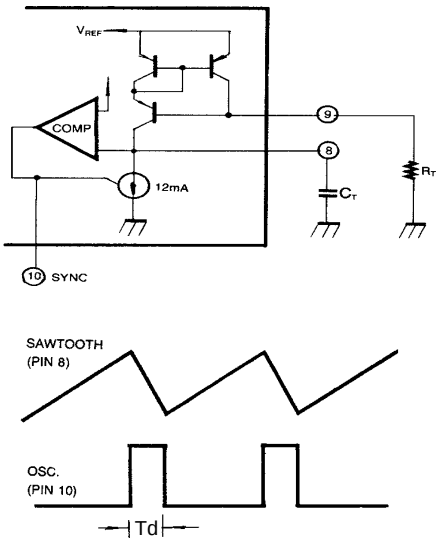
Notes :

1. Parameter measured at trip point at latch with $V_5 = V_{REF}$, V_6 = 0V
2. R_T = 10KΩ, C_T = 4.7nF
3. Amplifier gain definde as:

$$G = \frac{\Delta V7}{\Delta V4}; \Delta V_4 = 0 \text{to} 1.0V$$

4. Current into Pin 1 guaranteed to latch circuit in shutdown state.
5. Current into Pin 1 guaranteed not to latch circuit in shutdown state.
6. These parameters, although guaranteed over the recommended operating conditions, are not 100% tested in production.



OUTPUT DEADTIME(T_d)

Figure 1. KA3846 Oscillator Circuit

Output deadtime is determined by the external capacitor, C_T, according to the formula: $Td(us) = 145C_T(\mu F)\left(\frac{12}{12 - \frac{3.6}{R_T(K\Omega)}}\right)$
For large values of R_T: T_d (us) = l45C_T (uF) Oscillator frequency is approximately

by the formula: $f_T(KHz) = \frac{2.2}{R_T(K\Omega)C_T(\mu F)}$
